

CARADIGM[®] QUALITY IMPROVEMENT

DATA SHEET

Overview

As more healthcare organizations participate in value-based reimbursements, they have an increased responsibility to report on and improve quality measures. Caradigm Quality Improvement uses advanced data aggregation, healthcare analytics and a robust measure calculation engine to compute key patient safety and quality measures, benchmark performance at the institution and provider level, and explore data at a cohort and patient level to identify and close gaps in care.

Caradigm's Quality Improvement application helps healthcare organizations evolve from retrospective quality reporting to proactive performance improvement, and to use intelligence to identify gaps in care and take action within clinical workflows at the point of care.

Healthcare organizations can also use the application to conduct quality improvement campaigns. The highly configurable solution integrates with the workflows of quality managers and clinicians.

Key Features

- Advanced Computation Engine
- Performance Benchmarking
- Quality Gaps Analysis
